Why Is Communication Health Important?

We experience the world through our senses, by communicating with each other and with our surroundings. We use communication to learn, to express ourselves, to work and to build and nurture relationships.

Communication disorders can have a significant impact on our physical, emotional, social, vocational and financial well-being. The earlier that a disorder is identified and treated, the better a person’s chances are for improvement or even recovery.

What Do Speech-Language Pathologists and Audiologists Do?

Speech-language pathologists are professionals who work with people of all ages to prevent, assess and treat speech, language, voice, swallowing and cognitive communication disorders.

Audiologists are professionals who work with people of all ages to prevent, assess and treat hearing loss, tinnitus (ringing in the ears), other auditory disorders and balance disorders.

About SAC

Speech-Language and Audiology Canada (SAC) is a member-driven organization that supports, promotes and elevates the professions of our members and associates. We are the only national organization passionately supporting and representing speech-language pathologists, audiologists and communication health assistants inclusively. Through this support, we champion the needs of people with communication disorders.

To learn about our annual Speech and Hearing Month campaign, please visit www.maymonth.ca.

If you think you, or someone you know, has a communication disorder, consult a speech-language pathologist or audiologist today. www.communicationhealth.ca.
Speech, language, thinking and swallowing problems are often caused by stroke, head and neck cancers, traumatic brain injury or neurodegenerative diseases (such as Alzheimer’s, dementia, Parkinson’s or ALS).

**Hearing loss** and other auditory disorders may be caused by aging, noise exposure, head injury, medications or may be present from birth.

**Balance disorders** may be caused by certain medications, inner ear problems, ear infections or head injury.

**Speech, language, thinking and swallowing problems** are often caused by stroke, head and neck cancers, traumatic brain injury or neurodegenerative diseases (such as Alzheimer’s, dementia, Parkinson’s or ALS).
